PRODUCT DESCRIPTION

The 12.7x99mm is a cartridge developed for the Browning .50 caliber machine gun in the late 1910s and remains the most common heavy machinegun caliber in use today. Entering service officially in 1921, this cartridge is based on a scaled-up .30-06 cartridge. It is a standard cartridge for US and NATO forces as well as many non-NATO countries. When used in machine guns, cartridges are linked into disintegrating belts using metallic links. The .50 BMG cartridge is also used in anti-materiel rifles. A wide variety of ammunition is available, and the availability of match grade ammunition has increased the usefulness of .50 caliber rifles by allowing more accurate fire than standard rounds. **FEATURES:** Wide variety of configurations for specific applications Brass cartridge case Non corrosive primers US milspec and commercial grade specifications available **SPECIFICATIONS:** Call or RFQ for precise specifications on particular configurations US and other source origin manufacture available based upon requirements and conditions Typical configurations available: M2 Ball M1 Tracer M2 Armor Piercing M17 Tracer M8 Armor Piercing Incendiary M20 Armor Piercing Incendiary Tracer M1 Incendiary M903 SLAP M962 SLAP-T XM156 Spotter Tracer
